

Update Moonflower's Coffee to jQuery

Getting Started

GitHub Repository

<https://github.com/htc-ccis2591/jquery-moonflowers>

You'll want to begin each assignment by forking the repository and cloning it locally. When you are done, you'll push to GitHub and submit a pull request.

Include jQuery using a CDN

In the index.html file, add the script tag as follows:

```
<script src="https://code.jquery.com/jquery-2.1.4.js"></script>
```

Move code into jQuery ready

Wrap the code that "just runs" with the jQuery `$(document).ready` function.

```
$(document).ready( function() {  
    ...  
} );
```

Note that you can still put this in your IIFE. You don't always want everything inside of the ready function, but for this example, that is fine.

Use jQuery functions for DOM Manipulation

Replace the use of `document.getElementById` with the jQuery function. Use jQuery functions for things like the JavaScript `nextElementSibling`, `getAttribute()`, `setAttribute()`, etc.
